## Minor Courses offered by the Department of Computer Science

| Year / Sem                              | Type of<br>Course               | Course Code         | Title of the Course                                    | Credits | Teaching<br>Hours |
|---|---------------------------------|---------------------|--|---------|-------------------|
| 1 <sup>st</sup> Year<br>(Semester-      | MID-1                           | CSCS102             | Microprocessor and<br>Assembly Language<br>Programming | 4       | 5                 |
| I & II) MID-2 CSCS106 Microco<br>Progra | Microcontrollers<br>Programming | 4                   | 5  |         |                   |
| 2 <sup>nd</sup> Year                    | MID-3                           | CSCS203             | System Software  | 4       | 5                 |
| (Semester-<br>III & IV)                 | MID-4                           | CSC209              | Embedded Application<br>Development                    | 4       | 5                 |
| 3 <sup>rd</sup> Year                    | MID-5                           | CSCS304             | Theory of Computation                                  | 4       | 5                 |
| (Semester-<br>V & VI)                   | MID-6                           | CSCS310/<br>CSCS311 | UNIX System Programming<br>/ Network Programming       | 4       | 5                 |
| 4 <sup>th</sup> Year                    | MID-7                           | CSCS404/<br>CSCS405 | Artificial Intelligence /<br>Compiler Design           | 4       | 5                 |
| (Semester-<br>VII)                      | MID-8                           | CSCS406/<br>CSCS407 | Cyber Security /<br>Internet of Things                 | 4       | 5                 |

| Year           | I          | I Course Code: CSCS102 Credits   |                                 |                 |     |
|----------------|------------|--|---------------------------------|-----------------|-----|
| Som            |            | Course Title: Microprocesso  | r & Assembly Language           | Hours           | 75  |
| Sem.           | '          | Programming  |                                 | Category        | С   |
| Course         |            | Number Systems (binary,  | octal, hexadecimal) and their   | r conversions   |     |
| Prerequisites, |            | • Boolean Algebra, logic ga  | tes, flip-flops and registers   |                 |     |
| if any         |            | Concepts in Combination  | al and Sequential logic         |                 |     |
| Internal       | End        | l Semester Marks: 75   | Duration of ESA (Theory):       | 03 hrs.         |     |
| Assessment     |            |  | Duration of ESA (Practical      | ): 03 hrs.      |     |
| Marks: 25      |            |  |                                 |                 |     |
|                |            | • Learn the architecture &   | organization of 8085 Micropr    | ocessor         |     |
| Course         |            | Understand and classify t  | ine instruction set of the 8085 | Nicroprocess    | or  |
| Outcomes       |            | <ul> <li>Apply the memory &amp; I/O</li> <li>Applyze the architecture</li> </ul> | and operation of Programmal     | ble interface   |     |
| Outcomes       |            | <ul> <li>Analyze the architecture</li> <li>Create applications to in</li> </ul>  | terface various peripheral IC   | 's with Intel 8 | 085 |
|                |            | microprocessor   | tendee valious peripheral le    | 5 With filter o | 005 |
| Unit No.       |            | Course Co  | ntent                           | Hours           |     |
|                | 1          | Theory Com   | ponent                          |                 |     |
|                | Inti       | roduction to Microprocessors   | & 8085 Assembly Language        |                 |     |
|                | Pro        | gramming   | , , ,                           |                 |     |
|                | Mic        | croprocessors – Instruction se   | t and computer languages –      |                 |     |
| Unit I         | 808        | 35 programming model – 🛛   | nstruction classification -     | 9               |     |
|                | Inst       | ruction – Data format and s  |                                 |                 |     |
|                | pro        | gram – 8085 Instruction Set  |                                 |                 |     |
|                |            |  |                                 |                 |     |
|                | 808        | 5 Microprocessor architectur   |                                 |                 |     |
|                |            | Dovices 2025 MDU 202   |                                 |                 |     |
| Linit II       | 1/0<br>me  | mory interfacing - 8155 mer  | ٩                               |                 |     |
| Onich          | Inte       | erfacing I/O devices: Basics – I   | 5                               |                 |     |
|                | dev        | vices – memory mapped I/O  |                                 |                 |     |
|                |            | , , ,  |                                 |                 |     |
|                | Pro        | gramming 8085  |                                 |                 |     |
|                | Inst       | ruction Set of 8085 – Data Tra   | ansfer – arithmetic – Logic –   |                 |     |
| Unit III       | Bra        | nch – Writing ALP and Debug  | gging programs – Looping –      | 9               |     |
| o ne ne        | Cοι        | inting and Indexing – 16-bit Ar  | ithmetic instructions – Logic   | 5               |     |
|                | ope        | erations – Counters and Time   | Delay                           |                 |     |
|                | Inte       |  |                                 |                 |     |
|                | Sta        | ck and subroutines – Restart –   | Conditional call and Return     |                 |     |
|                | inst       | rruction – Advanced subr   | outine concepts – Code          |                 |     |
|                | cor        | version – BCD Arithmetic an  | d 16-bit operations – BCD-      |                 |     |
| Unit IV        | Bin        | ary conversion – Binary to BCI   | Conversion – BCD to seven       | 9               |     |
|                | seg        | ment LED code conversion -   | Binary to ASCII and ASCII to    |                 |     |
|                | bin        | ary conversion – BCD addition  |                                 |                 |     |
|                |            |  |                                 |                 |     |
|                | Inte       | erfacing Peripheral (I/O) and  | Applications                    |                 |     |
|                | Inte       | errupts: 8085 Interrupt – RST  | Instructions – Software and     |                 |     |
|                | Har        | uware interrupt – multiple   | interrupts and Priorities –     |                 |     |
| Unit V         | 000<br>Q10 | 5 vectoreu interrupts – Kesta<br>5 – Multipurpose progra                         | mable Device – 8270             | 9               |     |
|                | Pro        | grammahle Keyhoard/Disn  | lav Interface – 8275            |                 |     |
|                | Pro        | grammable peripheral Interfa   | ce                              |                 |     |
|                |            |  |                                 |                 |     |

| Practical Component |   |          |  |  |  |
|---------------------|---|----------|--|--|--|
|                     | 1. Assembly Language Programming for Arithmetic                 |          |  |  |  |
|                     | Operations like Addition, Subtraction, Multiplication           |          |  |  |  |
|                     | and Division on 8, 16-bit data                                  |          |  |  |  |
|                     | 2. Assembly Language Programming for different                  |          |  |  |  |
|                     | logical operations  |          |  |  |  |
|                     | 3. Assembly Language Programming for code                       |          |  |  |  |
|                     | conversions   |          |  |  |  |
| Exercises           | 4. Assembly Language Programming for sorting 30                 | )        |  |  |  |
|                     | 5. Assembly Language Programming for Searching                  |          |  |  |  |
|                     | 6. Assembly Language Programming for memory block               |          |  |  |  |
|                     | transfer  |          |  |  |  |
|                     | 7. Assembly Language Programming using subroutines              |          |  |  |  |
|                     | 8. Assembly Language Programming using counters and             |          |  |  |  |
|                     | time delay  |          |  |  |  |
|                     |   |          |  |  |  |
|                     | Recommended Learning Resources                                  |          |  |  |  |
|                     | 1. Ramesh S. Gaonkar, "Microprocessor – Architecture, Programm  | ing and  |  |  |  |
| Drint               | Applications with the 8085", Penram International Publishe      | r, Sixth |  |  |  |
| Posourcos           | Edition, 2013.  |          |  |  |  |
